Report generated 2026-06-14

01 Executive Summary

The investigation confirms a malware infection where a malicious executable masqueraded as the SysInternals Suite. The malware performed unauthorized network communication to malware430.com, modified the hosts file, installed a fake Windows service mimicking VMware to maintain persistence, and attempted anti-forensic measures by deleting prefetch files.

Null Hypothesis Evaluation: The user intentionally installed a legitimate SysInternals tool which triggered false positive security alerts. This is refuted by the presence of unauthorized network connections to known malicious domains (malware430.com), the modification of the hosts file, and the installation of a service mimicking VMware, which are inconsistent with legitimate SysInternals behavior.

Identified MITRE ATT&CK Techniques: T1036.005, T1070.004, T1071.001, T1543.003
